

UrKey Technology

Apacer UrKey is a USB-based 2 way dongle for data security. It acts as a token for activating or triggering security functions. Basically, the UrKey is pre-programmed with a designated Apacer security features among Erase, Destroy, or Write Protect, depending on requests.

Each UrKey is unique to its pairing SSD due to the identification recognition process. In other words, the identifications between the UrKey and the SSD have to match in order to trigger the security feature. If the UrKey is connected with another SSD, the drive firmware would not be able to recognize the identification and thus no function will be triggered.

Hardware connection via Micro USB

Hardware connection via Type-A USB
